TREW®

Print and Apply

Improve operations with automated print and apply solutions to increase throughput accuracy and labor efficiency.

Print and apply systems apply labels directly to products in motion and are ideal solutions for applying labels with barcodes, serialization, 2D or QR codes, shipping information or personalization. Most often seen in shipping and receiving applications in distribution and fulfillment environments, Trew's print and apply (PandA) eliminates manual label application and can apply to a single or multiple sides of a product with options to provide an overlay for packing lists or easy customer return labels.

Trew's PandA solution is unique, as it features motorized driven rollers (MDRs) at the infeed and exit of the operation, providing accumulation and product metering that optimizes scanner performance and label print and tamp times. The MDR technology improves the overall throughput while automatically providing a buffer to accommodate a wide variety of product dimensions.

Trew's project execution team is very experienced with PandA additions and understands how such an implementation can positively impact operations. The installation is meticulously planned with a phased approach, taking advantage of planned downtime.

Features & Benefits:

- Improved read rate – Accurate label placement increase read rate to over 99%

- Increased shipping accuracy – Labels are verified prior to leaving PandA area to ensure the right product to the right customer

- Improved sustainability – MDRs are energy efficient and labels are not applied when product not present

- Auto carton adjustments – Motorized driven rollers dynamically meter packages, eliminate back pressure and stop when no product is present

- Easy to maintain & operate – Highly reliable solution can operate virtually non-stop with minimal supervision, allowing labor to be allocated to other areas
